

## Course 1: Section 1: Lesson 10 Skill End Project- Agile in Jira

Using Jira, I started a new project titled “CT Course 1 Business Project”, with the loose idea that it was for an iOS app intended for custom content delivery: perhaps like news and updates for a company's products.

I then created two epics, one an overarching iOS requirement and one for initial design meetings. It's possible the Epic is too large, and should be broken into smaller, yet still big tasks: Not as small as stories but not “build the whole app”. I have since created more epics like “Connect to the Database and deliver updated content” that seems more manageable in scope for an Epic. The second Epic I created is to schedule initial meetings with the client to sketch out early requirements for what the app should be and how it should look.

For user Stories, I started with a request that a user opening the app be presented with a login page. As a custom content delivery app, login will be encouraged. It is possible a client might allow guest browsing of untargeted content, but a login might be a core feature of the app. The login user story is a straightforward ask for a standard UID and Password style login page. I specified Acceptance Criteria as “being able to sign in to the home page” and listed some Validation test cases.

The second story I created was a scheduled meeting with the client to discuss the core functionality and look of the home page.

I do not understand what is meant by “create cancel client meeting user story”. I can delete the meeting story above, or I suppose create a story that cancels said meeting? If I need to redo this assignment I will need further clarity on what is being asked here, it is phrased oddly.

Lastly, I added stories to the sprint, assigned team members (only myself), checked story points, and started a two week sprint to work on the above stories.
