

Section 7- CSS Skill Assessment

I separated out the CSS inline styling and internal styling and moved them to their own CSS sheet, located in a new folder in the project. I included rel references on the matching HTML sheets to link them to their CSS files.

I tried changing some of the form settings, but not everything can go into the CSS files. I played further with some of the styling within the CSS files themselves. I also tried using different selectors to style by element, id, and class. I've also left some inline styling in so I can test specificity and see what rule take precedence while a page is being rendered.
