Course 1: Section 3- GIT Skill Assessment

Using Powershell, I created a new Project Directory, Added and edited a ReadMe.md file, and initialized a git repo locally in said directory. I did not know where the project resources are located, supposedly I am supposed to push a source file that is given to me. It does not seem particularly relevant to the assessment however, so I just saved a random .html file to use in its place. I saved that into the project directory as well.

I logged on to github and created a new repo there. Back in Powershell, I added the github project as a remote origin. I then added the source file, the random .html file to be tracked by git, checked the status to see it had not been added, then performed a commit with an appropriate message. Lastly, I pushed to remote, and verified on github that the push was successful: the .html file is displayed in a commit and is accessible on github.
